cont

1
Claims 1-2 (cancelled)

Claim 3. (Previously amended): The method of Claim 8, wherein the system also includes a lens system, and wherein the at least one property is focal length of said lens system.

Claim 4. (Previously amended): The method of Claim 8, wherein the system also includes a lens system, and wherein said property is f-number of the lens system.

Claim 5. (Previously amended): The method of Claim 8, wherein the operator depends on a source of illumination used to generate the image.

Claim 6 (Previously amended). The method of Claim 8, wherein said operator depends on the type of scene captured in the image.

Claim 7 (Cancelled)

Claim 8. (Currently amended) A method of processing a digital image produced by an optical system including a sensor that detects less than full color at each pixel location, the method comprising:

accessing an operator including an array of demosaicing weights, values of the weights determined by at least one property of the optical system;

forming a plurality of input vectors from the image, each input vector including a plurality of pixel intensities; and

S.N. 09/177,729 Page 3

applying the operator to the input vectors to produce a full color at each of
a plurality of pixels of the digital image.

D1
Cont
Claim 9. (Previously amended) The method of claim 8, wherein the operator compensates for degradation in the optical system.

Claim 10. (Previously added) The method of claim 8, wherein each input vector is formed from super pixels.

Cl
Cont
Claim 11. (Previously added) The method of claim 8, wherein the operator is used for all resolutions, and a resulting fixed resolution image is resampled.

Claim 12. (Previously added) The method of claim 8, wherein the operator is also based on a set of known images.

Claim 13. (Previously added) The method of claim 8, wherein different operators are used for different images.

Claim 14. (Previously added) A processor for performing the method of claim 8.

Claim 15. (Previously added) An article for a processor, the article including computer memory encoded with instructions for causing the processor to perform the method of claim 8.

Claim 16. (Previously added) A digital camera including a processor programmed to perform the method of claim 8.

ent

Claim 18. (Previously added) A method of generating a linear operator for demosaicing of a digital image by a digital camera, the method comprising using camera parameters to design coefficients for the linear operator.

Claim 19. (Previously added) The method of claim 18, wherein a standard noise model and a linear minimization technique are used to generate the coefficients from the camera parameters.

Claim 20. (Previously added) A computer programmed to perform the method of claim 18.

Claim 21. (New) The method of claim 8, wherein the values of the demosaicing weights are determined to additionally compensate for image degradation.

Claim 22 (New). The method of claim 8, wherein the operator is accessed from a plurality of different operators.

Claim 23 (New). The method of claim 22, wherein the operators are included in T-matrices.

Claim 24 (New). The method of claim 8, wherein the at least one property contributes to image degradation.

~~Claim 25 (New). The method of claim 8, wherein the at least one property is variable from system to system.~~

~~Claim 26. (New) The method of claim 18, wherein the camera parameters are used so that the coefficients are designed to perform both demosaicing and compensation of image degradation by the digital camera.~~
